

# Week 2: Risk and Reward: Modeling High Uncertainty Settings

---

- ◆ High-Uncertainty Settings: Stock Price Example
- ◆ Probability Distributions: Scenario Approach
- ◆ Parameters of the Probability Distributions: Expected Value, Variance, Standard Deviation
- ◆ Uncertainty and Risk

**Session 1**

# Week 2: Risk and Reward: Modeling High Uncertainty Settings

---

- ◆ Common Scenarios for Multiple Random Variables
  - ◆ Risk Reduction Example: Investing in a Pair of Stocks
  - ◆ Calculating and Interpreting Correlation Values **Session 2**
- 
- ◆ Using Scenarios for Optimizing Under High Uncertainty: Portfolio Selection Problem
  - ◆ Sensitivity Analysis and Efficient Frontier

# Investing in a Single Stock: Reward and Risk

# Common Scenarios for Multiple Random Variables

---

- ◆ Consider stocks X and Y with returns “tomorrow” described by two equally probable scenarios

Scenario	Return on Stock X	Return on Stock Y	Probability
1	0.004	0.003	0.5
2	-0.002	-0.001	0.5

# Common Scenarios for Multiple Random Variables

---

- ◆ Consider stocks X and Y with returns “tomorrow” described by two equally probable scenarios

Scenario	Return on Stock X	Return on Stock Y	Probability
1	0.004	0.003	0.5
2	-0.002	-0.001	0.5

- ◆ Each scenario can represent actual returns of Stock X and Stock Y observed on the same trading day in the past
- ◆ For example, under Scenario 1, the return on Stock X,  $R_X$ , is 0.004 and, simultaneously, the return on Stock Y,  $R_Y$ , is 0.003

# Common Scenarios for Multiple Random Variables

- ◆ Consider stocks X and Y with returns “tomorrow” described by two equally probable scenarios

Scenario	Return on Stock X	Return on Stock Y	Probability
1	0.004	0.003	0.5
2	-0.002	-0.001	0.5

- ◆ Expected value of the  $R_X$  is  $E(R_X) = 0.5*0.004+0.5*(-0.002) = 0.001$ , standard deviation of  $R_X$  is  $SD(R_X) =$

$$\sqrt{0.5*(0.004-0.001)^2+0.5*(-0.002-0.001)^2}=0.003$$

# Common Scenarios for Multiple Random Variables

- ◆ Consider stocks X and Y with returns “tomorrow” described by two equally probable scenarios

Scenario	Return on Stock X	Return on Stock Y	Probability
1	0.004	0.003	0.5
2	-0.002	-0.001	0.5

- ◆ Expected value of the  $R_X$  is  $E(R_X) = 0.5*0.004+0.5*(-0.002) = 0.001$ , standard deviation of  $R_X$  is  $SD(R_X) =$

$$\sqrt{0.5*(0.004-0.001)^2+0.5*(-0.002-0.001)^2}=0.003$$

- ◆ Expected value of the  $R_Y$  is  $E(R_Y) = 0.5*0.003+0.5*(-0.001) = 0.001$ , standard deviation of  $R_Y$  is  $SD(R_Y) =$

$$\sqrt{0.5*(0.003-0.001)^2+0.5*(-0.001-0.001)^2}=0.002$$

# Risk Reduction Example: Investing in a Pair of Stocks

---

- ◆ A company invests \$50,000 into each of the stocks **X** and **Y** “today”

Scenario	Return on Stock X	Return on Stock Y	Probability
1	0.004	0.003	0.5
2	-0.002	-0.001	0.5

- ◆ How much profit will this investment bring “tomorrow”?

# Risk Reduction Example: Investing in a Pair of Stocks

- ◆ A company invests \$50,000 into each of the stocks **X** and **Y** “today”

Scenario	Return on Stock X	Return on Stock Y	Probability
1	0.004	0.003	0.5
2	-0.002	-0.001	0.5

- ◆ If Scenario 1 is realized tomorrow, the company's profit will be  $\$50,000 \times (0.004) + \$50,000 \times (0.003) = \$200 + \$150 = \$350$

# Risk Reduction Example: Investing in a Pair of Stocks

- ◆ A company invests \$50,000 into each of the stocks **X** and **Y** “today”

Scenario	Return on Stock X	Return on Stock Y	Probability
1	0.004	0.003	0.5
2	-0.002	-0.001	0.5

- ◆ If Scenario 1 is realized tomorrow, the company's profit will be  $\$50,000 \times (0.004) + \$50,000 \times (0.003) = \$200 + \$150 = \$350$
- ◆ If Scenario 2 is realized tomorrow, the company's profit will be  $\$50,000 \times (-0.002) + \$50,000 \times (-0.001) = -\$100 + (-\$50) = -\$150$

# Risk Reduction Example: Investing in a Pair of Stocks

- ◆ A company invests \$50,000 into each of the stocks **X** and **Y** “today”

Scenario	Return on Stock X	Return on Stock Y	Probability
1	0.004	0.003	0.5
2	-0.002	-0.001	0.5

- ◆ If Scenario 1 is realized tomorrow, the company's profit will be  $\$50,000 \times (0.004) + \$50,000 \times (0.003) = \$200 + \$150 = \$350$
- ◆ If Scenario 2 is realized tomorrow, the company's profit will be  $\$50,000 \times (-0.002) + \$50,000 \times (-0.001) = -\$100 + (-\$50) = -\$150$
- ◆ Expected profit is  $0.5 \times \$350 + 0.5 \times (-\$150) = \mathbf{\$100}$ , and the standard deviation of profit is  $\sqrt{0.5 \times (\$350 - \$100)^2 + 0.5 \times (-\$150 - \$100)^2} = \mathbf{\$250}$

# Risk Reduction Example: Investing in a Pair of Stocks

---

- ◆ Now, consider stock Z with returns “tomorrow” described by two equally probable scenarios

Scenario	Return on Stock X	Return on Stock Y	Return on Stock Z	Probability
1	0.004	0.003	-0.001	0.5
2	-0.002	-0.001	0.003	0.5

# Risk Reduction Example: Investing in a Pair of Stocks

---

- ◆ Now, consider stock Z with returns “tomorrow” described by two equally probable scenarios

Scenario	Return on Stock X	Return on Stock Y	Return on Stock Z	Probability
1	0.004	0.003	-0.001	0.5
2	-0.002	-0.001	0.003	0.5

- ◆ Stock Z has returns that are identical to those for Stock Y, but in different scenarios

# Risk Reduction Example: Investing in a Pair of Stocks

---

- ◆ Now, consider stock Z with returns “tomorrow” described by two equally probable scenarios

Scenario	Return on Stock X	Return on Stock Y	Return on Stock Z	Probability
1	0.004	0.003	-0.001	0.5
2	-0.002	-0.001	0.003	0.5

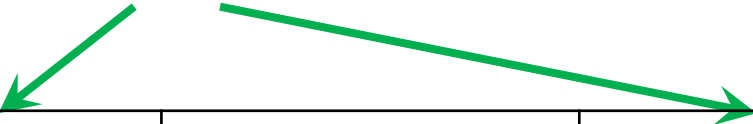

- ◆ Stock Z has returns that are identical to those for Stock Y, but in different scenarios
- ◆ Expected value of the  $R_Z$  is  $E(R_Z) = 0.5*(-0.001)+0.5*(0.003) = 0.001$ , standard deviation of  $R_Z$  is  $SD(R_Z) =$

$$\sqrt{0.5*(-0.001-0.001)^2+0.5*(0.003-0.001)^2}=0.002$$
